

# Bobath Concept: Human Movement Analysis as a Basis of Clinical Intervention

29 January 2019

The Bobath Concept is a problem solving approach to the assessment and treatment of individuals with disturbances of function, movement and postural control due to a lesion of the central nervous system.

The rationale for current practice is based upon present day knowledge of motor control, motor learning and neural plasticity, as well as on knowledge of biomechanics.

## **Course description:**

This course is run over three weekends with the first module designed to introduce participants to the concept of movement analysis in the assessment and treatment of adults with neurological or neuromuscular dysfunction and the second and third modules will expand on this concept further.

The course consists of a theoretical introduction to movement analysis, practical sessions, and a patient demonstration.

This course is run by the LSCIC Physiotherapy team at the RNOH. It is aimed at Band 5 and 6 physiotherapists and occupational therapists and is on the following dates:

- Saturday 9 February – Sunday 10 February
- Saturday 16 March – Sunday 17 March

- Saturday 13 April – Sunday 14 April

(All three weekends are 1 and half days. Timings will be advised nearer the date).
