A Patient’s guide to

Total Shoulder Replacement
This leaflet provides information, which will help you prepare for admission to hospital. Treatment is always planned on an individual basis so your experience may differ slightly from the information given.

The Shoulder and Elbow unit is a multidisciplinary team and all members work closely together. The team consists of Specialist Consultant Surgeons, Specialist Doctors in training, a Clinical Nurse Specialist, Specialist Physiotherapists and Occupational Therapists. All our staff are here to help and answer any questions you may have to provide a quality service.

**Why do I need a Total Shoulder Replacement?**

The most common reason for a Total Shoulder Replacement (TSR) is arthritis where the joints have worn out and therefore may have become painful, swollen and restricted in movement. A TSR may also be used following a fracture.

A TSR is primarily performed for relief of pain in the shoulder. However as the pain improves you may find you have better movement and function.

**What is a TSR?**

The shoulder joint is a ball (Humeral Head) and socket (Glenoid) joint. A TSR replaces the ball and socket with an artificial joint. This is called a prosthesis and there are several different types. Your consultant will select the best type for you depending on the quality and quantity of bone as well as the strength of the muscles around your shoulder joint. In certain cases a bespoke prosthesis may need to be designed and made for you.
This type of prosthesis is designed from a CT scan of your shoulder joint. This is called a CADCAM.

**Basic anatomy pictures**

- **Normal shoulder**
- **Arthritic shoulder**
- **Total shoulder replacement**
Are there any possible complications?

All operations involve risk and potential complications. Although rare, it is important that you understand them. There are risks to you in general and risks of the procedure itself. There are potential complications of the procedure. These include:

- **Sickness/nausea, heart problems, breathing problems and nervous system problems** - relating to the anaesthetic.
- **Infection** - All possible precautions are taken to avoid infection during your operation. A superficial skin infection is treated with antibiotics. However, if the metalwork of the TSR becomes infected it may need to be removed and replaced.
- **Deep Vein Thrombosis (DVT)** - A DVT is a blood clot in the deep veins of the calf or thigh. To reduce the risk of developing a DVT and to help with your circulation you will be given stockings and will be asked to wear special inflatable sleeves around your legs whilst in bed. These inflate automatically and provide pressure at regular intervals, increasing blood circulation in your legs. You may require blood thinning medication which will be decided by the consultant depending on the risk factors. The physiotherapist and nursing staff will show you how to exercise your legs and ensure that you start to move about quickly after your operation. If a clot develops and part of it breaks away, it can travel to the lungs where it is called a Pulmonary Embolus (PE). A PE is potentially life threatening and so everything is done to prevent a DVT from developing. We ask you to help by wearing your stockings at all times while you are in hospital except when you are bathing.
• **Dislocation** - Initially a TSR is not as stable as a normal shoulder joint so there is a small chance of dislocation. This means that the ball comes out of the socket and will require a doctor to correct it or further surgery to relocate it back to its correct position. To prevent this from occurring there will be post-operative movement restrictions. Your arm will be supported in a sling and instructions will be given on how to use it.

• **Stiffness** - This happens to nearly all TSRs early on and is treated through the therapy exercise programme.

• **Nerve/blood vessel damage around the shoulder** - The risk of this is less than 1%. If it happens we will investigate it carefully and may ask other experts in the hospital for their advice and help in restoring the nerves and blood vessels to best function.

• **Fracture (a Break) of surrounding bone** - If this happens we may fix the fracture straight away, or give you a special brace to wear if it has not moved too far apart.

• **Loosening of Prosthesis** - Over a period of time the TSR may become loose and further surgery may be required to correct this. It may be due to infection, but more often it is simply due to using our shoulders in the course of normal daily life.
Before coming into hospital

Pre-assessment

Shortly before your operation you will be asked to attend a pre-assessment anaesthetic and medical screening and may require a further pre-assessment appointment for the anaesthetist to see you. This is a medical examination to make sure you are well enough for surgery.

You may also be assessed by an occupational therapist (OT) at the pre-assessment clinic or over the telephone or via a questionnaire. The OT will review the information you provide, to highlight any functional concerns that may arise, on how you will cope with daily life following surgery. If you have any particular concerns regarding how you will manage after your surgery please contact the OT team on the number provided in this booklet.

Contraceptive Pill or hormone replacement therapy (HRT)

You will need to discuss with your doctor about possibly stopping any medicines containing hormones (for example, the oral contraceptive pill, HRT or Tamoxifen) six weeks before surgery.

Wearing nail polish, nail decorations or false nails (hands and feet)

Please remove nail varnish, decorations or false nails prior to coming in. Failure to do so could lead to your operation being cancelled or delayed. This is due to the monitoring that is used in theatres whilst under anaesthetic and to reduce risks of infection.
**Transport**

Patients are responsible for their own transport to and from the hospital. You will be informed of your admission and discharge date in advance so that you can arrange for a relative, friend or taxi to transport you. In most cases it will not be appropriate to use public transport on discharge. Please note that patients who wish to claim their travel costs must prove that they are eligible to do so by providing relevant benefit documentation and travel receipts.

If you are eligible for patient transport the assessment team will be able to assess your needs through a brief telephone conversation. The interview remains completely confidential. Transport control room can be contacted on 0207 510 4637. Any enquires relating to booked journeys please call 0208 909 5895.
The Operation

Before your operation one of the surgical team will discuss the surgical procedure with you and answer any questions you may have. You will be asked to sign a form giving your consent to the operation. You will also be visited by an anaesthetist to discuss your anaesthetic.

Interscalene Nerve Block

An interscalene block is an injection of local anaesthetic around the nerves that supply your arm. The purpose of the injection is to provide pain relief for the operation. When you wake up from the general anaesthetic the shoulder and upper arm will be numb.

Interscalene block is offered for shoulder surgery because it is the best form of pain relief for this procedure in the first 24 hours after the operation. It is important that you are aware that it is not the only method for providing pain relief for this type of operation and also that it does not affect what the surgeon will do. Your anaesthetist will discuss the pros and cons of this procedure as well as the possible complications and alternatives with you on the day.
Post operatively

When you wake up from the operation your arm will be in a sling. You may feel some pain and discomfort, which will be helped by the medication. If you have had a nerve block, your arm and hand can feel numb and heavy, this will usually resolve itself within 24 hours. The shoulder may initially be bruised, tender and swollen and have a dressing over the wound. This will be a water resistant dressing. However, please check with your nurses before showering.

You may also have the following:

- Small drainage tubes coming from your wound
- Patient Controlled Analgesia (PCA) Device
- Oxygen mask
- A drip to replace lost fluids

These will be removed as soon as possible following the surgery.

Once the anesthetic has worn off you will be encouraged to mobilise, with help if needed, as soon as you are able. This will prevent the risk of some post operative complications.
Post operative therapy

Following a TSR the surrounding muscles and tissues need time to heal, and it is important that you avoid certain movements to reduce the risk of complications. These are guidelines only and may vary person to person.

0-6 weeks

Your consultant will clearly state in the operation record your restrictions and for a minimum of 6 weeks these are likely to include:

- Wear sling at all times
- No active use of operated arm
- Only move arm as guided by the therapists
- No hand behind back
- No weight bearing e.g. pushing up from a chair, carrying anything or holding a stick
- No hand across chest
- Do not allow arm to fall backwards past the midline of your body, please support upper arm with pillow when lying down

NB - Your consultant may perform a Biceps Tenodesis as part of your procedure. This involves detaching and re-attaching a tendon of the biceps. To allow this to heal you will not be allowed to actively bend and straighten your elbow. The therapist will advise you further.
6-16 weeks

- Wean out of sling and wear only as necessary i.e. when tired, or in crowds
- Maintain your physiotherapy exercises as instructed by your physiotherapist
- Commence light, un-resisted movements/activities at waist level
- Avoid hand behind back
- Avoid weight bearing e.g. pushing up from chair, using a walking stick
- Gradual return to functional activities
- Avoid activities/exercises that increase pain

16+ weeks

- Return to normal activities within comfortable limits
- Be mindful of activities above shoulder height
- Be mindful of heavy tasks
Exercises

You will be seen by a physiotherapist after your surgery to discuss your post-operative restrictions and show you your exercises. Your physiotherapist will also refer you on for outpatient physiotherapy; you can usually choose where this takes place. The following exercises are typically given following this surgery however they may vary for each individual. **DO NOT** commence these exercises until guided by a therapist.

**Neck, shoulder blade, forearm, wrist and hand**

These parts of the body will not be directly affected by the surgery and therefore you can move them normally. Complete the following movements as comfort allows:

- Neck movements in all directions
- Shoulder shrugs
- Forearm rotations (palm up, palm down), keeping your arm in the sling
- Freely move wrist and fingers
Shoulder and Elbow

You may need assistance with the following exercises. If you have any concerns about how to complete the exercises please discuss this with your therapist.

Starting position for the following exercises

Lie on your back with a towel/pillow under your operated arm.
Straighten the elbow of your operated arm assisting the movement with your other hand by sliding your arm along your body.

**If you have had a Biceps Tenodesis you should not straighten your elbow fully. Only to the 30 degrees angle shown in the picture.**

Assist your operated arm to rotate outwards to neutral, in line with your body.

Do not go beyond this unless directed to do so by your therapist.
Assist your operated arm into the position shown as comfort allows.

Do not go beyond [ ] degrees.

This is a static exercise and the shoulder should not move. You will be providing gentle resistance from your non-operated arm.

Gently push your operated arm outwards against your other hand.

Gently push your operated arm inwards against your other hand.

Yes [ ] No [ ] Repeat [ ] Times [ ] /day
This is a static exercise and the shoulder should not move. You will be providing gentle resistance from your non-operated arm.

Gently push your operated arm forwards against your other hand.
Activities of Daily living

You will be assessed by an occupational therapist after your surgery to discuss how you will manage your daily activities whilst wearing the sling. You will be one handed for a period of time and the following advice gives some tips on how to manage. Any equipment suggested can be purchased through the companies detailed at the end of this booklet.

Washing and Dressing

Your occupational therapist will discuss your personal care activities with you. Depending on your restrictions you may be provided with a sling for showering. Showering is advised as opposed to taking a bath to protect the wound and to avoid weight bearing on your operated arm. Your wound dressing is water resistant however you should avoid direct exposure to water when showering. Please be advised that your balance may be affected while wearing a sling and therefore consider safety aspects when stepping in/out of the bath/shower or on uneven ground..

You will require loose clothes that preferably button down the front. Avoid clothing with small buttons, hooks and zips. Ladies may find a bra uncomfortable and may prefer to wear a strapless or front-fastening bra. Consider slip-on, easy fitting shoes.

You will usually be allowed to wear your sling over clothes but will need to check this with the team. Always dress your operated arm first and undress it last.
Dressing Procedure in a Sling

Sit on the bed and place a pillow(s) under your arm so it is rested in the sling position.

Undo the Velcro fastenings at the elbow and wrist. This will release the shoulder strap. You do not need to undo the Velcro on the shoulder strap.

Gently slide out the sling from underneath your forearm by pushing down into the pillows. Keep the operated shoulder as still as possible.
Thread the sleeve onto your operated arm and take the garment as far up to the shoulder as possible. Keep the operated shoulder as still as possible.

You will then be able to put your non operated arm into the sleeve, bringing the garment up and around your shoulders to do the clothing up.
Replace the sling by gently sliding it under your forearm. Replace the Velcro fastenings. You may need to lean forward to do up the fastenings.

For undressing complete this procedure in reverse.

If you have been provided with a Collar ‘n’ Cuff for showering use the above procedure for guidance on how to put on and take off.
**Sleeping**

Avoid lying on your operated arm initially. Lying on your back may be the most comfortable position. A pillow placed behind the operated arm may be advised to prevent the arm from falling backwards. Your therapist will advise you.

**Domestic Tasks**

Use ready prepared meals or items that need little preparation e.g. pre-chopped vegetables. There is equipment available which can help with food preparation, for example easy grip jar openers, pizza cutters. Some of these are available in large supermarkets or from the suppliers which are listed at the back of this booklet. Your occupational therapist will advise you if required.

You should avoid heavy household duties that may put undue stress on your shoulder until approximately 12 weeks post op or when advised by your physiotherapist.

**Returning to work**

You will probably be off work for approximately 6 weeks depending on the type of job you have. If you are involved in lifting, overhead activities or manual work you are advised not to do these for 3-6 months. However a light sedentary job may be resumed as soon as you feel able after the operation. Please discuss any queries with the team.
Driving

You should not attempt to drive until you are out of your sling, your pain has subsided and you feel confident in your own ability. You should avoid driving for about 10 weeks, however please confirm this with your consultant. If your ability to drive has been affected you are required by law to contact the DVLA and you may need to inform your insurance company of your operation as your insurance may be invalid.

Returning to leisure activities

Prior to restarting any leisure activities it is advised you discuss them at your post-operative clinic review or with your outpatient therapist. The ability to return to leisure activities will depend on pain, range of movement, strength and the procedure undertaken. Non-contact activities such as gentle jogging, light gym work, gentle swimming and light gardening tasks may be resumed from 6 weeks. Over-arm sports, particularly racquet sports should be avoided for 16 weeks. Contact sports should generally be avoided for up to six months.
**Going home**

We aim to discharge you from hospital within 3 days of the surgery however this may vary depending on your needs. The ward nurses may change your dressings if they become wet and give you water resistant dressings to take home with you. Prior to discharge we need to ensure that:

- You can mobilise safely
- You have adequate social support,
- You understand your exercises and precautions
- Your pain is managed with effective pain relief
- Your wound is clean and dry
- Your post-operative x-ray is satisfactory

**Aftercare**

On discharge a district/practice nurse appointment will be arranged to check your wound. Excessive redness or inflammation of the wound must be reported to your GP.

A surgical clinic appointment will be arranged for approximately 6 weeks post op and this date will be sent to you at home.

**Please note that this is an advisory leaflet only. Your experiences may differ from those described.**
Useful contacts

In the event that you are unable to contact a member of the upper limb team and feel that you have an urgent problem, you should visit your GP or local emergency department for advice.
